Summary of the research

This age is witnessing a unique progress in the information and technology revolution which affected many fields to a great deal. One of the fields that was greatly affected is the educational field as this revolution changed learning styles and strategies. It also changed the technology used in learning and teaching processes. Moreover, it opened new horizons in developing teaching, presented new teaching methods which help in developing the society, offering solutions to many educational problems, and satisfying different educational needs.

The information and technology revolution led to E-Learning by the end of the nineties of the last century and focused on using advanced technology in the teaching field turning traditional classrooms into virtual classrooms through using the internet and information technology. Gradually, practical experience and scientific research proved some drawbacks in E-Learning i.e. it is expensive and lacks the human interaction between the teacher and learner.
