Abstract

Cairo is considered one of the cities in which the elements of population attraction are available. Because of its cultural aspects that made it one of the most important countries in the world during the study period. This study is considered one of the important and new studies because it is exposed to a topic that archaeological studies did not address before, and the study aims to explain the causes of human overcrowding in the city of Cairo at the time of the study, and the ensuing urban activity inside and outside the city. The study followed the descriptive analytical approach. And it concluded that the urban congestion inside Cairo resulted in functional and spatial replacement processes within it, and urban growth in its appearance and suburbs.
