

# ***The effect of program for small collective games on the level of social interaction and aggressive behavior for children affected with Alexithymia***

*\*. Dr. / Aliaa Abdel Moneim Ibrahim*

Assistant Professor, Department of Basic Sciences, Faculty of Kindergarten, Al-Fayoum University

## ***The research aim***

The research aims to identify the effect of program for small collective games on the level of social interaction and aggressive behavior for children affected with Alexithymia

## ***Research hypotheses***

1. There are statistically significant differences between the averages of pre and post measurements, in the level of aggressive behavior for the children under 6 years of the research sample.
2. the averages of pre and post measurements, in the level of social interaction for the children under 6 years of the research sample.
3. the averages of pre and post measurements, in the level of emotional disorder (Alexithymia) for the children under 6 years of the research sample.

## ***Research procedures***

### **Research Method: -**

we used the was used method to design pre and post measurements for one experimental group, as it suits the nature of the research.

### **The research sample:-**

Community of research included children with disorders of feelings attending the kindergarten in Faculty of kindergarten, Forum university aged (6) years, research sample was chosen with deliberately way, children attending before in the nurseries were 12 children, in addition to (8) Children to conduct the scoping study research.

## ***Conclusions***

1. Collective small games of the suggested program has a positive effect on aggressive behavior for the children of research sample.
2. Collective small games of the suggested program has a positive effect on social interaction for the children of research sample.
3. collective small games of the suggested program has a positive effect on reduction of alexithymia level for the children of research sample-
