

**Aim:**

The study investigated the relationship between attachment styles of female university students and the accuracy of recalling the negative and positive events of life.

**Sample:**

the sample consists of (23) female students from the psychology section. They were administered the attachment styles inventory translated by the researcher and three tasks for emotional memory.

**Results:**

It was found that the secure students remember the positive events more than the negative events while the fearful and anxious students remember the negative events more than the positive events.
