أستاذ الأشغال الفنية المساعد

كلية التربية النوعية

جامعة الفيوم

Technology and human genius have changed the world. Most of our children use calculators and freely use cell phones, send messages via computer and talk to their friends, relatives and specialists in all fields in different countries using Chat room, Face book, E-mail. If we look at the pattern of this rapid change and this huge amount of information that we must absorb and analyze, we find that students must acquire a different kind of skills in order to be able to coexist with this changing society. In this era characterized by the flow of knowledge and the information revolution, the need has become more urgent to reach methods that work on information control in light of traditional education systems, so the need to use the Internet has emerged. The next step that is being looked forward to with the diversity of services provided on the Internet is the use of electronic courses, in order to provide an effective educational climate that helps to arouse students' interest and motivate them to learn.
